Internal water transmission and heating systems

## Company profile

The Tweetop company was established in 2001. Since that time, year by year, the sales volume of the Tweetop system has been consistently increasing. Thanks to the company's rapid development in 2008 Tweetop became a pipe producer. At the end of 2010, Tweetop started the production of fittings.

The main product of the company is the Tweetop system, based on multilayer pipes and press fittings - the most modern system in the plastic pipe world. Tweetop offers pipes and fittings in dimension range of 14 – 75mm with all the necessary tools and accessories dedicated to different applications, from household to industrial ones. The core application of the Tweetop system is surface heating, where turnkey solutions along with design services are delivered to the customer.

All of our specialists, whether working in a trade, logistics, production departments, or quality control, have significant experience in the field. This assures the quality of services on every single level, from development to supply of our products. Thanks to the expertise of our team, each client is guaranteed a full individual professional service, from the beginning to the very end.

Full product technical support is always provided by experienced application engineers, certified with design licenses required by Polish building law.

Tweetop meets the latest EU standards, which is why the declaration of compliance with EU standards for the Tweetop system can be issued if requested.

## Production and quality control

Tweetop manufactures top-quality multilayer pipes since 2008, using modern extrusion production lines. In June 2011 a new production line manufactured by a leading German company was installed. The sophistication and efficiency of our machines allow us to significantly increase our production capacity. By the end of 2010, Tweetop launched the production of fittings.

The most important part of our production department is the quality control. Thanks to the well-equipped laboratory, Tweetop can control raw materials as well as the final products. The company can conduct all the necessary tests recommended by European standards and technical approvals. Additionally, Tweetop provides multiple various tests, such as thermocycler test (according to DVGW W542); internal pressure resistance test; adhesion force test – dissection resistance; expansion test – stretching resistance; heat test; control of marking, appearance, and geometry of pipes; ball test (internal diameter check); mass flow rate test (MFR).

Press rings are included for all press fittings

## Tweetop Pressed System 14-75 mm

The main method of joining Tweetop pipes is the use of pressed fittings. The connection between the pipe and the fitting is obtained by pressing the pipe into the fitting's profile in the connection area, using a pressing tool equipped with U-type jaws, adapted to the type of fitting. The tightness of the connection chamber is guaranteed by two O-ring seals, perfectly integrated into the joint area. Pressed fittings can be used in the floor groove or a wall furrow. Tweetop fittings are manufactured from pressed type CW617N brass, resistant to dezincification, which makes them resistant to corrosion.

#### Information

Manifold made of stainless steel, 2-12 circuits

a) in set:

- supply and return manifold
- air vent and dewatering set for supply and return manifold
- manifold brackets
- nipples 3/4" for every circuit

b) connection with installation by thread 1" (screw connection)

## Tweetop Compression Fittings 16-25 mm

Tweetop threaded (compression) fittings are made of nickel-plated brass in the diameter range from 16mm to 25mm. Thanks to advancements in the production process, the occurrence of material defects is almost non-existent. Nickel-plating prevents the washout of zinc and brass corrosion. The main advantage of using such a fitting type is that its installation does not require specialized and expensive tools.

## Tweetop UFH System

Tweetop surface heating is a low-temperature central heating system, which ensures a feeling of thermal comfort inside the room, thanks to the steady heat distribution on the whole heated area. This vertical temperature distribution is very beneficial due to the fact that it makes the floor heating characteristic very close to the ideal temperature distribution curve. The main advantage of the Tweetop floor system is its economy, thanks to the fact that the surface heating systems operate at low temperature parameters (the most often used temperatures are: 45/35°C,  $\Delta T=10$  K, max. temp is 50°C).

## 55 Underfloor heating systems

## EcoVent Recu recuperators

Tweetop **EcoVent Recu** recuperators are modern, energy-efficient ventilation units dedicated to air exchange with simultaneous heat recovery. Thanks to the control of the air circulation process inside the building and the ability to adjust its intensity, Tweetop recuperators provide a continuous supply of fresh air while removing used air and moisture from the rooms.

Products from the **EcoVent Recu** series are equipped with the following features\*:

- innovative design
- compact dimensions,
- lightweight,
- effective internal by-pass,
- easily replaceable filters,
- easily removable: heat exchanger and fans,
- possibility to change the location of the supply and exhaust stubs,
- complete range of capacity 350, 450, and 600 m<sup>3</sup>/h,
- efficiency >85%, maximum 95%,
- aesthetic, multifunctional housing equipped with universal handles that allow mounting in different planes,
- high-efficiency counterflow heat exchangers manufactured by Recair Holland,
- reliable German Ziehl - Abegg fans,
- intuitive, aesthetic control system based on humidity measurement, allowing full adaptation of the air exchange in the house to own needs, optionally equipped with an Internet module,
- easy-to-read touch controller.

### In set with the device:

- pre-heater to protect the heat exchanger from the possibility of freezing,
- the controller,
- handles that allow for assembly in various planes,
- power cord.

\*Specifications of the devices are subject to change. Please refer to the newest version of this catalogue available at [www.tweetop.com](http://www.tweetop.com) for the latest information.

## **EcoHeat Mono 2** heat pumps comprehensive home heating solution

Tweetop EcoHeat Mono 2 heat pump series is a modern, economical, and efficient solution for heating and domestic hot water preparation. These Monobloc heat pumps allow for smooth regulation of heating capacity thanks to DC INVERTER technology, can operate in both heating and cooling functions, and have a wide operating range.

## 92 EcoHeat Mono 2 heat pumps

### EcoHeat Mono 2 heat pumps

	description	energy efficiency class	heating power	code	unit	package
92.01	EcoHeat Mono 2 P06 heat pump	A+++/A++	6,2 kW	9160201	pcs	1
92.02	EcoHeat Mono 2 P08T heat pump	A+++/A++	8,3 kW	9160203	pcs	1
92.03	EcoHeat Mono 2 P10T heat pump	A+++/A++	10,0 kW	9160205	pcs	1
92.04	EcoHeat Mono 2 P12T heat pump	A+++/A++	12,1 kW	9160207	pcs	1
92.05	EcoHeat Mono 2 P14T heat pump	A+++/A++	14,5 kW	9160209	pcs	1
92.06	EcoHeat Mono 2 P16T heat pump	A+++/A++	16,0 kW	9160211	pcs	1

## Pipes joining – step by step

### Pressed connections

1. Cut the pipe to the preferred length with the pipe cutter or other recommended tool, perpendicular to the pipe axis.
2. Chamfer the pipe edges with the beveling tool.
3. Push the pipe into the fitting between the stainless steel ring and body of fitting until the white face of the pipe appears in all the inspection openings of the stainless steel ring.
4. Press the joint with the manual or electric pressing tool, equipped with U type clamping jaws.

### Screw connections (turned joints)

1. Cut the pipe to the preferred length with the pipe cutter or other recommended tool, perpendicular to the pipe axis.
2. Chamfer the pipe edges with the bevelling tool.
3. Put the nut onto the pipe and then put the cut ring.
4. Push the fitting body into the pipe (up to the end).
5. Tighten the fitting with the nut by using a wrench. While turning the nut, the pipe should not rotate. Tighten again after 15-20 minutes.

### Remarks:

- Pressed joints (as the non-separable ones) can be used for connecting pipes in wall chases and floor screed.
- To make pressed connections, use only U profile jaws.
- For manual pressing tools, calibrate the device before starting the work so that when you try to close the pressing tool without a fitting, the jaws close at 100%.
- Manual pressing tools are tested for 5000 pressings.
- Turned joints (screw connections) may be used only in visible locations.
- Installation work connected with laying pipes must be carried out only at temperatures above: 0°C, whereas in case of making connections the lowest allowable temperature is 5°C. Before assembling it is strongly recommended to condition pipes and fittings for a period of min. 4h in temp. 14°C.
- Pipes may only be cut perpendicular to their axis with the system pipe cutters so that the end of the pipe lies evenly on the fitting around its entire circumference.
- The pipe's end should be chamfered with the use of a beveling tool before making the connection.
- While making connections with usage of transition couplings (press, screw or push type) equipped with threads with threaded elements of valves, other devices or threads of other couplings, it is necessary to remember that the threads of both elements must be compatible with each other and meet standards referred to in point 7.1.4 of EN ISO 21003 part 3 - fittings. In the event of a discrepancy, apply transition adapters, allowing the transition from one type of thread to another.
- **It is forbidden to bend the pipes at a distance of fewer than 10 times their external diameter from the fitting due to the necessity to eliminate excessive bending force load on the fittings.**

## Tweetop Smart PUSH assembly instructions

### Fittings for homogeneous and multilayer plastic pipes

Connection of pipes with fittings should be made in following order:

**1. Cutting** - cut the pipe to the desired length perpendicular to the pipe axis:

- Use only circular cutters.
- Do not use saws for pipes cutting.
- No chips should remain on the pipe's end.

**2. Calibrating** - bevel the pipe, it is recommended to use the system bevelling tools.

Before calibration, mark the pipe with a marker, setting the depth of inserting the pipe into the fitting, according to the following recommendation:

Depth of inserting the pipe into the fitting [mm]		
Homogeneous and multilayer pipes		
diameter [mm]		
d16	d20	d25
19	22	27

The pipe ending must be uniformly chamfered and free from burrs.

**3. Connecting** - push the pipe into the fitting until it reaches the mark left on the pipe wall by the system bevelling tool or made with a marker. Remember to insert a chamfered pipe into the tip of the pre-assembled stiffening sleeve. The sleeve should be completely inserted into the pipe. The sleeve increases the strength of the installed pipe and reduces the possibility of leaks at transverse loads.

Make sure that the mark on the pipe is visible at the edge of the fitting and lightly but firmly pull the pipe in the opposite direction, in order to finally block the pipe inside the fitting's socket.

Please read the remarks on the next page.

## Tweetop Smart PUSH Assembly instructions Fittings for copper pipes

Connection of pipes with fittings should be made in the following order:

**1. Cutting** - cut the pipe to the desired length perpendicular to the pipe axis:

- Use only circular cutters.
- Do not use saws for pipes cutting.
- No chips should remain on the pipe's end.

**2. Deburring and calibration** - copper pipes should be cleaned from internal and external burrs after cutting. To remove any irregularities left, use typical manual or mechanical deburring machines. Soft pipes stored in coils have naturally deformed cross-section. During cutting, pipes stored in straight sections are also deformed. To restore the proper shape and dimension of the pipe, use the correct mandrel or calibration sleeve with a diameter matching the diameter of the pipe. After calibration, mark the pipe with a marker, setting the depth of inserting the pipe into the fitting, according to the following recommendation:

Depth of inserting the pipe into the fitting for pipe d15 [mm] = 24

**3. Connecting** - push the pipe into the fitting until it reaches the mark, made earlier on the pipe wall.

Make sure that the mark on the pipe is visible at the edge of the fitting and lightly but firmly pull the pipe in the opposite direction, to finally block the pipe inside the fitting's socket.

### Remarks:

- SmartPUSH connections can be disconnected at any time using a special tool available within the Tweetop offer. The disconnecting procedure consists of pressing the fastening ring with the disconnecting device (the device provides a large pressure area on the ring) against the fitting body, thereby unlocking the joints. As a result, the connector body can be reused. It is important to visually inspect the o-ring inside the fitting (the deformed gasket should be replaced with a new one). At the same time, it should be remembered that for safety, after disassembly of the fitting, the pipe's end that was locked within the connector should be cut and the deburring and calibration operations should be carried out again.
- Installation work connected with laying pipes must be carried out only at temperatures above: 0°C, whereas in case of making connections the lowest allowable temperature is 5°C. Before assembling it is strongly recommended to condition pipes and fittings for a period of min. 4h in temp. 14°C.
- It is prohibited to put fingers into the fitting – the toothed ring can cause injury.
- Smart PUSH fittings may only be installed in visible places. Their use in floor screed and wall grooves is prohibited.
- The closest support location in relation to the fitting's end is 4cm.
- While passing through walls or ceilings, locate the joint socket at least 4 cm from the edge of the protective pipe's end.
- As fixed points when compensating thermal elongations for installations using Smart PUSH couplings, cooperating with homogeneous PERT pipes or multi-layer pipes, use well-twisted steel holders with a rubber spacer, subject to the distance from the coupler socket provided above.
- The pressure test plugs for the Smart PUSH system may only be used once.
- Smart PUSH fittings can be used with Tweetop EVOH-PERT pipes in combination with pressed fittings without restrictions.
- When using Smart PUSH fittings for Tweetop PERT-AI-PERT pipes, press fittings should not be used at the same time in installations of this type. The transition between the sections with Smart PUSH and pressed fittings should be made using transition couplings equipped with threads.
- While making connections with usage of transition couplings (press, screw or push type) equipped with threads with threaded elements of valves, other devices or threads of other couplings, it is necessary to remember that the threads of both elements must be compatible with each other and meet standards referred to in point 7.1.4 of EN ISO 21003 part 3 - fittings. In the event of a discrepancy, apply transition adapters, allowing the transition from one type of thread to another.
- **It is forbidden to bend the pipes at a distance of fewer than 10 times their external diameter from the fitting due to the necessity to eliminate excessive bending force load on the fittings.**

## Pressure test / Leak test

### Heating installations

**Test pressure**

maximum working pressure + 2 bar

**Constant water temperature**

water temperature change of 10°C causes pressure change of 0.5 – 1 bar.

### Water installations

**Test pressure**

1.5 x value of maximum working pressure

**Constant water temperature**

water temperature change of 10 K causes pressure change of 0.5 – 1 bar

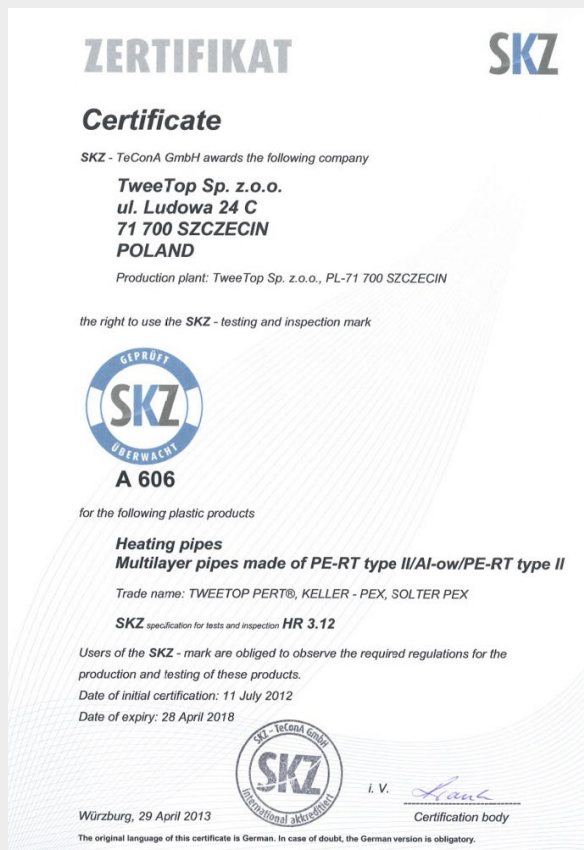

## Tests approval conditions

Test type	Duration [min]	Test approval conditions
Preliminary stage 1	30	Pressure decrease not more than 0,6 bar, no condensation or leaks
Pause	10	
Preliminary stage 2	30	Pressure decrease not more than 0,6 bar, no condensation or leaks
Main	120	Pressure decrease not more than 0,2 bar, no condensation or leaks
